

B4 - x86_64 Assembler

B-ASM-400

MinilibC

Going deeper into the rabbit hole

MinilibC

binary name: libasm.so
group size: 1
repository name: ASM_minilibc_\$ACADEMICYEAR
repository rights: ramassage-tek
language: x86-64 Assembly
compilation: via Makefile, including re, clean and fclean rules

- Your repository must contain the totality of your source files, but no useless files (binary, temp files, obj files,...).

The objective of this project is to create a dynamic ELF library to replace (to a certain extent) the standard C library you use every day on your system.

Thanks to the *malloc* project and the bootstrap, you are now able to replace some functions with your own implementations through a dynamic library (which is called *weak binding*).

LD_PRELOAD

We will consider an approximate understanding of your own as proof of cheating. Instead, we urge you to commit broken code instead of copying code you don't really understand.
You have been warned!

Here are the functions to be implemented in your MiniLibC:

- strlen
- strchr
- memset
- memcpy
- strcmp
- memmove
- strncmp
- strcasecmp
- rindex
- strstr
- strpbrk
- strcspn

Refer to the respective **man** pages of the aforementioned functions for behavior specifications. You must stick to them.

BONUSES

Here are some suggestions for potential bonus points:

- additional functions: *read*, *write*, ...;
- additional architectures (32-bit x86 or ARM, for example);
- anything **useful** that comes to mind.
